Product Verse 2026

Campus 2.0

Find Your People.

You're surrounded by 5,000 people. So why is it still so hard to find your people?

A PRODUCT CHALLENGE

PRODCON: Product & Consulting Society

THE PROBLEM

A college campus can have thousands of students. Yet sometimes, finding one person can feel surprisingly difficult.

You want to participate in a hackathon, but you're missing a designer. You want to go for a morning run, but your friends aren't interested. You play guitar and want to jam with a drummer. You want to start a photography walk, play football, or find people interested in the same competition.

Today, students solve these problems through scattered WhatsApp groups, Instagram stories, club groups, personal contacts and word of mouth.

These channels are useful, but they are not designed specifically for discovering people based on shared interests, activities and goals.

The people you are looking for may already be 50 meters away.

You don't know how to find them.

THE OPPORTUNITY

A startup wants to build Campus 2.0: a product that helps students discover people and form groups around things they want to do together. Not a social feed, a notice board, or a notes portal — the core idea is simple: "I want to do something. Help me find people who want to do it too."

The product will launch on a single campus of approximately 5,000 students.

YOUR CHALLENGE

You are the founding Product Team, designing the first version of Campus 2.0. You have 5,000 potential users, 4 developers, ₹2 lakh, and 3 months. You cannot build everything — your job is to decide what Campus 2.0 should actually help students do.

Use Cases:

Finding teammates for competitions, people to jam with, activity partners, communities and hobby groups, players for sports, study partners, and collaborators for creative projects. You may choose one use case or combine several — but you only have three months, so scope matters.

Core User:

Who should Campus 2.0 serve first? Competitive students, hobby enthusiasts, athletes, creators, freshers, or students with niche interests? Choose your first target user and explain why.

Core Experience:

Design what happens when a student opens the app. One possible flow: choose or create an activity, see people interested, join or invite, form a group, do the activity, and return for the next one. This is only an example — you decide what the experience looks like.

MVP Scope:

With only four developers, you must prioritize. Potential features include profiles, interests, activity creation and discovery, search, matching, group chat, direct messaging, notifications, calendar, location, ratings, recommendations, club pages, event integration, AI matching, and anonymous posting. Sort these into Must Have, Should Have, and Not Now, and explain your reasoning.

The Matching Problem:

If a student writes "Looking for people interested in running," you may have 200 students with that interest — but not all are useful matches; timing, goals, and location all vary. Decide which signals should matter most: interest, timing, location, skill level, availability, goal, experience, or personality.

Real-World Success:

The goal isn't more time spent in the app — it's students leaving the app to actually do something together (App → Match → Group → Real-world activity). Define a success metric that reflects whether the product creates real connections.

DELIVERABLE

Round 1 — Deck Submission

A maximum 8-slide consulting deck covering:

The Problem: what makes existing solutions inadequate?

The User: who are you building for?

The Product: what are you building?

The User Journey — From opening the product to actually doing the activity

The MVP — What are you building first?

Matching & Growth — How do you create useful connections and solve the cold-start problem?

The Vision — What does Campus 2.0 become if it succeeds?

Implementation Roadmap / Success Metrics

(The above recommended deck design is for reference purposes only)

Important Note

Participants are encouraged to make reasonable assumptions where data or user insights are unavailable. All assumptions must be clearly stated and logically justified. Teams may propose creative solutions, but their recommendations should remain practical and feasible within the given constraints.

WHAT WE'RE LOOKING FOR

Understand users	**Identify real problems**	**Think creatively**
Prioritize	**Design simply**	**Learn from feedback**

ONE LAST THOUGHT

Thousands of students are already on the same campus.

The problem isn't finding people.

The problem is finding your people.

If you had three months and four developers,

what would you build to make that happen?
